Introduction

A document viewer's job is simple to state and hard to get right: open whatever file the user throws at it, render it faithfully, and stay out of the way. Nota is built around that idea, starting each file cold and showing a first page in a fraction of a second, even for large PDFs and image-heavy folders.

Under the hood, Nota renders PDF pages with the same engine macOS uses everywhere else, so text stays sharp at any zoom level and search finds every word. Markdown files are parsed and typeset live, code files get syntax highlighting for dozens of languages, and images are decoded and cached so scrolling through a folder never stutters.

None of that matters if the keyboard doesn't work the way people expect. Nota is built for people who navigate with the keyboard first: page up and down, jump to a page, zoom, and search are all one keystroke away, and the mouse is optional rather than required.

- Instant open for PDF, Markdown, code, and image files
- Native, crisp PDF rendering at any zoom level
- Live Markdown preview with syntax-highlighted code blocks
- Full-text search across the current document
- Fully keyboard-driven navigation

Feature comparison

The table below compares the core capabilities of Nota against macOS Preview and a typical web browser for the file types people open most often.

Feature	Nota	Preview	Browser
PDF rendering	✓	✓	–
Markdown preview	✓	–	–
Syntax-highlighted code	✓	–	–
Image viewing	✓	✓	✓
Keyboard-first navigation	✓	–	–
Instant cold start	✓	–	–

Keyboard shortcuts

1. ⌘O — Open a file
2. ⌘F — Find in document
3. ⌘+ — Zoom in
4. ⌘- — Zoom out
5. ⌘0 — Actual size
6. Space — Page down
7. ⇧Space — Page up
8. ⌘W — Close window

> The fastest interface is the one you never have to think about — every shortcut here does exactly what it says, every time.

Appendix

Installing Nota takes a single command, after which it can open the common file types directly. The snippet below shows the full flow from installation to opening a file.

```
# install and open a file
brew install --cask nota
open document.pdf
open README.md
open script.py
```

End of document.
